

Image Inpainting on the Edge

WORLD DOMINATION: VIKESH KANSAL, SRINIVAS KOLLA, DEVI
SUBRAMANIAM ANIVARTH VARMA PENUMETCHA, VENKATA NAGA SAI
KAUSHIK YADALA

Create an app that allows users to
remove objects from images and
fill gaps using generative models.

Problem Statement

Motivation

- ▶ To learn and apply the concepts of edge computing.
- ▶ Use the Qualcomm innovators development kit as a springboard to dive into the world of edge computing.
- ▶ Using state of the art hardware provided by Qualcomm to run AI models, especially image inpainting models, at the edge, using the CPU, GPU and the NPU (Hexagon Tensor Processor) or DSP (Digital Signal Processor).
- ▶ Get a taste of the exhilarating and enthralling world of embedded systems.

Methodology: Models

AOT-GAN

- ▶ Available on Qualcomm AI Hub
- ▶ Mentioned Metrics:
 - ▶ 120ms inference time
 - ▶ 8.35 inferences/s throughput
 - ▶ 0-157MB memory usage
 - ▶ 245 NPU Layers
 - ▶ Unquantized
 - ▶ Dimensions:
 - ▶ Image: (1x512x512x3)
 - ▶ Mask: (1x512x512x1)
- ▶ <https://aihub.qualcomm.com/models/aotgan>

LaMa-Dilated

- ▶ Available on Qualcomm AI Hub
- ▶ Mentioned Metrics:
 - ▶ 48.5ms inference time
 - ▶ 20.6 inferences/s throughput
 - ▶ 1-122MB memory usage
 - ▶ 340 NPU Layers
 - ▶ Unquantized
 - ▶ Quantized by us
 - ▶ Dimensions:
 - ▶ Image: (1x512x512x3)
 - ▶ Mask: (1x512x512x1)
- ▶ https://aihub.qualcomm.com/models/lama_dilated?searchTerm=ama

Framework

- ▶ Qualcomm SDK
 - ▶ Snapdragon Neural Processing Engine (SNPE)
 - ▶ TF-Lite Delegate
 - ▶ snpe-net-run
 - ▶ snpe-dlc-quant/snpe-dlc-quantize
- ▶ Android Framework
 - ▶ Kotlin/Java for routing and logic
 - ▶ C++/Java for the SNPE API
 - ▶ Gradle for management of dependencies
 - ▶ XML and Jetpack compose for UI
- ▶ Python (For similarity metrics)

Block Diagram

Parameters Considered

Performance Metrics

Inference Time

Memory Usage

CPU/GPU/NPU usage

Accuracy Metrics

Mean Squared Error (MSE)

Peak Signal to Noise Error (PSNR)

Structural Similarity Index Measure (SSIM)

Learned Perceptual Image Patch
Similarity (LPIPS)

Fréchet inception distance (FID)

Datasets

- ▶ Pictures taken by us (for testing)
- ▶ Image masks obtained from defacto-inpainting
 - ▶ <https://www.kaggle.com/datasets/defactodataset/defactoinpainting>
- ▶ Image JPG obtained from MSCOCO 2017 dataset
 - ▶ <https://www.kaggle.com/datasets/awsaf49/coco-2017-dataset>
- ▶ Utilized the above datasets to create a quantized model
- ▶ RAWs: generated from the above by us using python

Data Pre-Processing

- ▶ Conversion of Image for (jpg or png) to a tensor or RAW of the form (1,512,512,3) depending on the usage
 - ▶ Converted to RAW using a python script for use in snpe-bench and snpe-net-run
 - ▶ Converted to Tensors by the following methods
 - ▶ In the JAVA API, utilized pre-built functions for help in conversion
 - ▶ In the C++ API, manually loop through the pixels to convert the image to a tensor (Binary form) of the form mentioned above using Kotlin.
 - ▶ In the case of pre-defined mask, we also ensure the orientation of the mask and the image align

Data Post-Processing

- ▶ In the C++ API app created outputs a tensor that is similar to the input tensor we give, hence we just convert the given binary tensor by doing the reverse of what we did for the input.
- ▶ For the Java API, we utilized the same functions utilized for the input here to ensure proper conversion.
- ▶ For snpe-net-run, we created another file which would convert from the raw format to a readable jpg or png as the output.

Demo: Workflow (Pre NPU)

Workflow 1 (on app)

- ▶ Pre-process image and mask to the respective input tensors
- ▶ Run the DLC on the provided input tensors
- ▶ Post-process the output tensor into an output image
- ▶ Output the in-painted image, and performance metrics to the screen.
- ▶ Take the ideal image, and the inpainted image and pass it to python (on laptop) to get similarity scores

Workflow 2 (using SNPE)

- ▶ Pre-process image and mask to the respective raw files
- ▶ Run the DLC on the provided input tensors, using snpe-net-run and snpe-bench.py.
- ▶ Post-process the output raw into an output image
- ▶ Get the csv file from snpe-bench.py
- ▶ Take the ideal image, and the inpainted image and pass it to python to get similarity scores

Working on the NPU

- ▶ After multiple attempts (mentioned previously) we have found a pipeline that runs our models directly on the NPU from an app.
- ▶ Workflow:
 - ▶ Pre-process image and mask to the respective input tensors
 - ▶ Utilize the TF-Lite file of the model and run it on the NPU by using TF-Lite Delegate to delegate the TF-Lite model to run on the NPU
 - ▶ Post-process the output tensor into an output image
 - ▶ Output the in-painted image, and performance metrics to the screen.
 - ▶ Take the ideal image, and the in-painted image and pass it to python (on laptop) to get similarity scores
- ▶ Utilizes the Java API for interaction with the NPU and for building of the app.

Demo: Android App Functionalities

- ▶ The ability to upload a picture.
- ▶ Either choose a mask for the image or draw over an area to in-paint depending on the function of the app.
- ▶ Run the model to get:
 - ▶ The image output (for a regular in-painting app)
 - ▶ Benchmarking metrics (for the benchmarking app)
 - ▶ **In Progress**
 - ▶ Built for the app which runs on the CPU
 - ▶ For advanced methods like LPIPS, the benchmarking runs separately on a computer through a python script.

Output of Apps Created/Used

C++ API

- ▶ Output Image
- ▶ Run time on CPU
- ▶ Memory Usage
- ▶ PSNR
- ▶ SSIM

JAVA API (Pre and Post NPU)

- ▶ Output Image
- ▶ Run time on CPU
- ▶ Run time on GPU
- ▶ Run time on NPU
- ▶ RAM Usage
- ▶ Detailed Benchmarking done using Snapdragon Profiler

SNPE-BENCH.py

- ▶ Output Raws
- ▶ Excel Containing
 - ▶ Respective Runtime
 - ▶ Respective Memory Usage
 - ▶ Load Times and more
- ▶ For Similarity,
 - ▶ Utilize the python file to get:
 - ▶ MSE, PSNR
 - ▶ SSIM
 - ▶ LPIPS

CPU, GPU, NPU Benchmarking

UTILIZED SNAPDRAGON PROFILER TO GET THE USAGE METRICS OF THE CPU, GPU, NPU:

=====

Additional Achievements

- ▶ Got another inpainting model called AOT-GAN to run on the NPU.
- ▶ Created a 101 image dataset, with images, masks, and ideal images.
- ▶ Classified all our images based on the following criteria:
 - Resolution & aspect ratio - Basic image dimensions
 - Face detection - Uses MediaPipe to count faces
 - Texture analysis - Laplacian variance (blur detection) and edge density
 - Color analysis - Brightness, saturation, and dominant colors via k-means clustering
 - Text detection - Uses Tesseract OCR
 - CLIP embeddings - Semantic content understanding using OpenAI's CLIP model
 - Mask analysis - If a mask image is provided, it analyzes mask area, bounding box, location, and fragmentation
- ▶ Working on trying to utilize the above classifications to create a model selector (suggested by qualcomm)
- ▶ Working on getting another model that is not on the Qualcomm AI Hub to run on the NPU after optimizing and quantizing it for the NPU and converting the model into a TF-Lite.

Future Plans

- ▶ We have completed all the deliverables mentioned by Qualcomm for our project.
- ▶ Further suggestions on how to proceed to extra stuff by Qualcomm:
 - Create a pipeline such that the app chooses one of the models we have in our app based on what is being in-painted in the image. We need to choose the model that will perform best for the given image.
 - Try running the AI models for measuring the similarity of the inpainted images on the app itself.
